

Quadrant 1 - Exploration (High-level of human control within one body)
e.g. Biofeedback-assisted yoga app

- Interactive running fitness game - run in real life to escape virtual enemies
- Exoskeleton for construction sites to increase strength
- User-controlled prosthetics that move based on brain waves
- Sport training for athletes when they push their limits
↳ or one person sport

- Make the ~~train~~ training like a game - eg. AR, VR. It's an increase in user motivation.

offer some instant feedback, or "shadow" concept.
for instance, we can build a game in front of mirror.

& There is one screen ~~int~~ combined in mirror, which could ~~alarm~~ ~~warn~~ player if ~~they~~ their pose isn't standard.

Once game finished, the app will notify player how many wrong positions occurred and offer some suggestion to tackle.

2. strategy

→ imitation

→ dance game. ^{from} (slide) .

→ rehabilitation ~~the~~ treatments .
(e.g. stroke) .
sb having

→ technique training .

Rehab turns into a small game. Like board game ~ etc. ?

~~Project target: collaborative dance game. → suggests synchronised moves.~~
Setting some pause programs for unsynchronised gate occurred.

Robot that works based on brain activity of multiple users. For example, a robotic mining machine that can be controlled remotely by workers. Would eliminate risk of injury and accidents.

Action. ^{inter-corporeal} interactions. + computer control.

It could be more succinctly placed on the body.

For example, ~~use~~ apple watches, and don't make them complicated.

~~dance game. surgeons where~~

surgeons. where two people need to coordinate precisely.

using the apple watch Gyro sensor, to collect whole wrist ~~data~~ movement data. And matching them to find some gap. → and visualisation.

Collaborative training system - 1 user acts out the correct movements which other users will act out through electrical impulses. Users can then verify when they have the correct movement by acting it out for the first user. Would work through wearable devices that tracks movement and transfers this to a different user.

Part 4: Simulation → High interaction + Computer Control
Project aim for: Physical therapy for stroke rehabilitation.

Audio hints to give patients about "how to exercises in the right positions" → to win the credits or points.

Computer controls the sensors to detect the gestures, and calculate the Calorie ~~consumption~~ consumption.

or. refer about acupuncture. to stimulate patient skins.
if they do the wrong behavior.

- Wearable device that is used to break addictions. Senses when the user is about to relapse and uses electrical impulses to stop their movement.
- body protection device during having construction (~~plumber~~, workers etc)
plumber
- mind-controlled prosthesis
